

OPTIDRIVE[™] (É³

AC Variable Speed Drive 0.37kW – 37kW / 0.5HP – 50HP 110 – 480 Volt 1 & 3 Phase

Advanced Technical Manual

Revision History

sue	Note	Section	Date
)1	Pre-Release		05/01/16
)2	Added changes for V3.02 Firmware	N/A	04/02/16
	P-30 new functions	2.3.2	
	P00-47 New functions	2.5	
	Revised I/O table P-15 selection	2.6	
	Added parameter changes for 1 Phase Output Drive	2.4	
	Added Voltage levels for 110V drives	9.10.5	
	Revised Fire Mode Operation Description	2.8.1	
	Added CAN & Modbus info for new P-30	4.7.8	
3	Updated P-11 Max setting to "Drive Dependent"	2.3.1	01/03/16
	Updated P-18 Maximum Setting = 9	2.3.2	
	Updated P-25 Added setting 11	2.3.2	
	Updated P-30 Correcting error to Index 3	2.3.2	
	Updated P-51 adding setting 5	2.3.3	
	Updated P-52 description to add note regarding setting 5 for P-51	2.3.3	
	Updated I/O function tables to improve clarity	2.6.3	
4	Changes to include V3.03 Firmware		06/07/16
	Additional settings added to P-43	2.3.2	, -, -, -0
	Added field Gateway usage info	5	
	Added operating display info	2.8.3	
	Added introduction section	1	
	Added note regarding changing parameters when enabled	2.2	
5	Changes to include V3.05 Firmware	2.2	01/09/17
5	Corrected motor control mode selection parameter range	4.6.2	01/03/17
	Added additional P-01 upper limit info	2.3.1	
	Corrected range of P-05, P-10, increased range P-09	4.6.2	
	Revised order for switching frequency derating info	0	
	Added additional info for V3.05 firmware functions	2.2.4	
	 Additional parameter function in P-05 and P-06, additional info for P-13 D 36 today 2 representations 	2.3.1	
	- P-36 Index 3 new options	2.3.2	
	- P-60 function updated	2.3.3	
	- Added P-15 option 18	2.6.4	
	- Added P-15 option 18	2.6.5	
	- Added P-15 option 18	2.6.6	
	- Added P-15 option 18	2.6.7	
	Added information on 4kW reduced overload below 5Hz	9.10.5	
	Additional description of Effective Switching frequency changes	2.8.3	
	Corrected P-40 listing	2.3.2	18/10/17
6	Added changes for V3.06 firmware		21/05/18
	Corrected range of P-12	2.3.1	
	P-16, P-17, P-18, P-25, P-31, P-32, P-33, P-34, P-36, P-39, P-43 description updated	2.3.2	
	Changed range of P-48	2.3.3	
	Corrected scaling for CAN object 200Eh	4.5.4	3/10/18
	Added firmware changes for V3.07		17/7/19
	 P-60 Index 1 default setting changed 	2.3.3	
	- Add Modbus register 46	4.7.12	
	- Add 400V 1.2A drive rating		
	- Added IP66 Switch function options		
	 Added info for faults which require a time delay to reset 		
	Added Frame Size 5 Info		
	- Switching frequency info	3.1	
	- Boost setting range	3.2	
	Added changes for V3.08 firmware	1.1	13/8/19
	Added speed step info	2.8.4	, =, =
	Revised switching frequency derating information (new simplified format)	7.2	
	Added Heartbeat Consumer to CAN Object Table	4.5.4

1 About this Advanced Technical Manual

1.1 Compatibility

This Document is for use with version 3.08 Firmware.

Invertek Drives Ltd adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

The information in this user guide relates to the functionality of the firmware version as stated above. Prior versions of firmware may not fully support all functions as described. If necessary, firmware updates may be carried out using Optitools Studio PC software.

1.2 Intended Audience

This Advanced Technical Manual is intended to be used in conjunction with the standard User Guide included with the product and is intended to provide additional information for more advanced product applications and usage. The reader should be familiar with the contents of the standard product User Guide, and, should observe all safety warnings and installation guidelines contained therein.

2 Optidrive E3 Parameter Set Overview

2.1 About this section

This document provides a list of the available parameters, and a description of their respective functions, for the Optidrive E3.

2.2 Parameter Structure Overview and Access

The parameter set is arranged in Groups according to the following structure: -

Parameter Group	Range	Access Level	Access Type
P00	P00-01 to P00-20	Extended	Read Only
	P00-21 to P00-50	Advanced	Read Only
Basic Parameters	P-01 to P-14	Basic	Read / Write
Extended Parameters	P-15 to P-50	Extended	Read / Write
Advanced Parameters	P-51 to P-60	Advanced	Read / Write

Access to all parameter groups is controlled by setting P-14 as follows

P-14 = P-37 (Factory setting: 101) Allows Extended Parameter Access

P-14 = P-37 + 100 (Factory Setting: 201) Allows Advanced Parameter Access

In order to prevent possible damage to the drive and connected machinery, certain parameters are locked during operation of the drive to prevent change. In the case that the drive is enabled, and the user tries to change the parameter, an "L" is shown on the left of the display.

2.3 **Parameter Descriptions**

2.3.1 **Basic Parameters**

2.3.1	Basic Pa	rameters							
Par.	Descriptio					imum	Maximum	Default	Units
P-01		n Frequency / Speed Limit				-02	500.0	50.0 (60.0)	Hz / RPM

The revellation value after scaling and offset are applied to the signal. The res					,,,			-,, -,,			
b 0-10 Note: P39 Analog Input Offset and P-35 are applied to the signal. The resulting value will be displayed in P00-01. b 0-10 0 to 10VDC The drive will operate from -P-01 (Reverse Rotation, Maximum Frequency / Speed) to P-01 (Forward Rotation, Maximum Frequency / Speed) according to the applied signal level. b 0-10 0 to 10VDC The drive will operate the motor in the reverse direction of rotation if the analog reference after scaling and offset are applied to the signal. The resulting value will be displayed in p00-01. The drive will operate the motor in the reverse direction of rotation if the analog reference after scaling and offset are applied to the signal. The resulting value will be displayed in p00-01. The drive will operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the appled signal level current. Speal format applied at the terminal input must uni-polar. Maximum applied signal current must to the sceed 20nA. Note: P-39 Analog input Offset and P-35 are applied to the signal. The resulting value will be displayed in P00-01. Motor rotation mains in the same direction regardless of the result after scaling an offset are applied. The drive will operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) in P00-01. Motor rotation remains in the same direction regardless of the result after scaling an offset are applied in the terminal input must uni-polar. Maximum applied signal Current uses to e					ıni-polar.						
b 0-10. Motor rotation remains in the same direction regardless of the result after scaling an offset are applied. The resultant value after scaling and offset are applied may not exceed the range 0.00 100%. The drive will operate from -0.01 (Reverse Rotation, Maximum Frequency / Speed) to P-01 (Forward Rotation, Maximum Frequency / Speed) according to the applied signal level. Natic: P.39 Analog Input Offset and P-35 are applied to the signal. The resulting value will be displayed in 600 0. P 0-20 0 to 2000. The drive will operate the motor in the reverse direction of rotation if the analog reference after scaling and offset are applied is -0.0%. The resultant value after scaling and offset are applied may not exceed the range -300 to 200%. The free value operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the applied signal level current. Signal format applied at the terminal input must un-polar. Maximum applied signal current must not exceed 20mA. Note: P-39 Analog input Offset and P-33 are applied to the signal. The resulting value will be displayed in P00-01. E 1+20 4 to 20mA The drive will operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the applied signal level current. Signal format applied at the terminal input must un-ipolar. Maximum applied signal current must not exceed 20mA. Signal level = -4mA is treated as zero. Note: P-39 Analog input Offset and P-35 are applied to the signal. The resulting value will be displayed in P00-01. Motor rotation remains in the same direction regardless of the result after scaling an offset are applied in P00-01. Motor rotation remains in the same direction regardless of the result arescaling an offset are applied in P00-01. Motor rotat				Maximum applied signal voltage must not exceed	10VDC.						
Motor rotation remains in the same direction regardless of the result after scaling an offset are applied. b 0-10 D to 10 VDC The drive will operate from -P-01 (Reverse Rotation, Maximum Frequency / Speed) lo P-01 (Forward Rotation, Maximum Frequency / Speed) according to the applied signal (Ver. Note: P-39 Analog input Offset and P-35 are applied to the signal. The resulting value will be displayed in P00-01. The drive will operate the motor in the reverse direction of rotation if the analog reference after scaling and offset are applied is 40.0%. The revulant value after scaling and offset are applied may not exceed the range -100 to 100%. P 0-20 O to 20mA The drive will operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the applied signal current. Signal format applied signal current must not exceed 20mA. Note: P-39 Analog Input Offset and P-35 are applied to the signal. The resulting value will be displayed in P0-01. Motor rotation remains in the same direction regardless of the result after scaling an offset are applied. The resultant value after scaling and offset are applied to the signal. The resulting value will be displayed in P0-01. Motor rotation remains in the same direction regardless of the result after scaling an offset are applied. The drive will operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the applied signal current must not exceed 20mA. Signal format applied signal curren				Note: P-39 Analog Input Offset and P-35 are appli	ed to the sign	al. The resultir	ng value will be	displayed			
The resultant value after scaling and offset are applied may not exceed the range 0.0 to 100%. b 0 - 10 Do to 2000C b directional Note: P-39 Analog input Offset and P-35 are applied to the signal. The resulting value will be displayed in P00-01. The drive will operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the applied signal level. R 0-20 0 to 20mA The drive will operate from P-02 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the applied signal level current. Signal format applied a the terminal input must uni-polar. Maximum applied signal level current. Signal format applied and P-32 (Minimum Frequency / Speed) to P-01 (Maximum Frequency / Speed) according to the applied signal level current. Note: P-38 Analog input Offset and P-33 are applied to the signal. The resulting value will be displayed in P00-01. Motor rotation remains in the same direction regardless of the result after scaling an offset are applied. The resulting value will be displayed in P00-01. The drive will operate from P-02 (Minimum Frequency / Speed) according to the applied signal level current. Signal format applied at the terminal input must uni-polar. Maximum applied signal level current. Signal format applied at a spee. Motor rotation remains in the same direction regardless of the result applied signal level current. Sig

	1: Current Limit Reduction. When the overload accumulator reaches 90% of, the output current limit is internally reduced to 100% of P-08 in order to avoid an It.trp. The current limit will return to the setting in P-54 when the overload accumulator reaches 10%									

2. Optidrive E3 Parameter Set Overview

2.4 Alternative Parameter Functions for Single Phase Output Drives

Single phase output drives feature several changes in order to provide optimal operation with single phase motors. These changes are based around two key principles: -

- The Starting method for single phase motors requires the motor to be started at full speed in order to provide optimal starting torque. The starting boost parameters allow adjustment of this function to provide optimal motor starting.
- It is not possible to have reverse operation with a single-phase motor, thereby all reverse functions are disabled in the drive firmware.

	Description	on		Minimum	Maximum	Default	Units			
P-05	Stopping	Mode / Mains Loss Response		0	2	0	-			
	Selects th	e stopping mode of the drive, and the	e behaviour in response to a los	s of mains pov	ver supply duri	ing operation				
	Setting	On Disable	On Mains Loss							
	0	Ramp to Stop (P-04)	Ride Through (Reco	over energy from load to maintain operation)

2.5 Parameter Group 0 – Monitoring Parameters (Read Only)

- I							
Par.	Description	Explanation					
P00-01	1 st Analog input value (%)	100% = max input voltage					
P00-02	2 nd Analog input value (%)	100% = max input voltage					
P00-03	Speed reference input (Hz / RPM)	Displayed in Hz if P-10 = 0, otherwise RPM					
P00-04	Digital input status	Drive digital input status					
P00-05	User PI output (%)	Displays value of the User PI output					
P00-06	DC bus ripple (V)	Measured DC bus ripple					
P00-07	Applied motor voltage (V)	Value of RMS voltage applied to motor					
P00-08	DC bus voltage (V)	Internal DC bus voltage					
P00-09	Heatsink temperature (°C)	Temperature of heatsink in °C					
P00-10	Run time since date of manuf. (Hours)	Not affected by resetting factory default parameters					
P00-11	Run time since last trip (1) (Hours)	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip					
		occurred. Reset also on next enable after a drive power down.					
P00-12	Run time since last trip (2) (Hours)	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip					
		occurred (under-volts not considered a trip) – not reset by power down / power up					
		cycling unless a trip occurred prior to power down					
	Trip Log	Displays most recent 4 trips with time stamp					
	Run time since last disable (Hours)	Run-time clock stopped on drive disable, value reset on next enable					
	DC bus voltage log (V)	8 most recent values prior to trip, 256ms sample time					
P00-16	Heatsink temperature log (V)	8 most recent values prior to trip, 30s sample time					
P00-17	Motor current log (A)	8 most recent values prior to trip, 256ms sample time					
P00-18	DC bus ripple log (V)	8 most recent values prior to trip, 22ms sample time					
P00-19	Internal drive temperature log (°C)	8 most recent values prior to trip, 30 s sample time					
P00-20	Internal drive temperature (°C)	Actual internal ambient temperature in °C					
P00-21	CAN process data input	Incoming process data (RX PDO1) for CAN: PI1, PI2, PI3, PI4					
P00-22	CAN process data output	outgoing process data (TX PDO1) for CAN: PO1, PO2, PO3, PO4					
P00-23	Accumulated time with heatsink > 85°C	Total accumulated hours and minutes of operation above heatsink temp of 85°C					
	(Hours)						
P00-24	Accumulated time with drive internal temp >	Total accumulated hours and minutes of operation with drive internal ambient above					
	80°C (Hours)	80C					
P00-25	Estimated rotor speed (Hz)	In vector control modes, estimated rotor speed in Hz					
P00-26	kWh meter / MWh meter	Total number of kWh / MWh consumed by the drive.					
P00-27	Total run time of drive fans (Hours)	Time displayed in hh:mm:ss. First value displays time in hrs, press up to display					
		mm:ss.					
P00-28	Software version and checksum	Version number and checksum. "1" on LH side indicates I/O processor, "2" indicates					
		power stage					
P00-29	Drive type identifier	Drive rating, drive type and software version codes					
P00-30	Drive serial number	Unique drive serial number					
P00-31	Motor current ld / lq	Displays the magnetising current (Id) and torque current (Iq). Press UP to show Iq					
P00-32	Actual PWM switching frequency (kHz)	Actual switching frequency used by drive. If "rEd" is displayed, the switching frequency has been automatically reduced.					
P00-33	Critical fault counter – O-I	These parameters log the number of times specific faults or errors occur and are					
P00-34	Critical fault counter – O-Volts	useful for diagnostic purposes.					
P00-35	Critical fault counter – U-Volts						
P00-36	Critical fault counter – O-temp (h/sink)						
P00-37	Critical fault counter – b O-I (chopper)						
P00-38	Critical fault counter – O-hEAt (control)						
P00-39	Modbus comms error counter						
P00-40	CAN comms error counter						
P00-41	I/O processor comms errors						
P00-42	Power stage uC comms errors						
P00-43	Drive power up time (lifetime) (Hours)	Total lifetime of drive with power applied					
P00-44	Phase U current offset & ref	Internal value					
P00-45	Phase V current offset & ref	Internal value					
P00-46	Phase W current offset & ref	Internal value					
P00-47	Index 1: Fire mode total active time	Total activation time of Fire Mode					
	Index 2: Fire Mode Activation Count	Displays the number of times Fire Mode has been activated					
P00-48	Scope channel 1 & 2	Displays signals for first scope channels 1 & 2					
P00-49	Scope channel 3 & 4	Displays signals for first scope channels 3 & 4					
P00-50	Bootloader and motor control	Internal value					

2.6 Control Terminal Connections

For standard applications and operation, the basic control of the drive and functions of all drive input terminals can be configured using just two parameters, P-12 and P-15. P-12 is used to define the source of all control commands and the primary speed reference source. P-15 then allows fast selection of Analog and Digital Input functions based on a selection table.

2.6.1 P-12 Function

P-12 is used to select the main control source of the drive and the main speed reference according to the following table

P-12	Function	Control Source	Main Speed Reference	Notes
0	Terminal Control	Terminals	Analog Input 1	All control signals are applied to the control terminals.
				Functions are determined by P-15 Macro setting.
1	Keypad Control	Keypad / Terminals	Motorised Pot / Keypad	When keypad mode is selected, the default operation of
2	Keypad Control	Keypad / Terminals	Motorised Pot / Keypad	the drive requires the keypad Start & Stop buttons are
				used to control the drive. This can be changed using P-
				31 to allow the drive to be started from Digital Input 1
				directly.
3	Modbus RTU	Modbus RTU	Modbus RTU	Control of the drive operation is through the Modbus
				RTU Interface.
				Acceleration and Deceleration Rates are controlled by P-
				03 and P-04 respectively.
				Digital Input 1 must be closed to allow operation.
4	Modbus RTU	Modbus RTU	Modbus RTU	Control of the drive operation is through the Modbus
				RTU Interface.
				Acceleration and Deceleration Rates are also controlled
				by Modbus, P-03 and P-04 are disabled.
				Digital Input 1 must be closed to allow operation.
5	PI Control	Terminals	PI Output	Enable / Disable control of the drive is through the drive
				control terminal strip.
				Output frequency is set by the output of the PI
				Controller
6	PI Control with	Terminals	PI Output Added to Al1	Enable / Disable control of the drive is through the drive
	Analog Summation			control terminal strip.
				Output frequency is set by the output of the PI
				Controller, added to the value of analog input 1.
7	CAN	CAN	CAN	Control of the drive operation is through the CAN
				Interface.
				Acceleration and Deceleration Rates are controlled by P-
				03 and P-04 respectively.
				Digital Input 1 must be closed to allow operation.
8	CAN	CAN	CAN	Control of the drive operation is through the CAN
				Interface.
				Acceleration and Deceleration Rates are also controlled
				by Modbus, P-03 and P-04 are disabled.
				Digital Input 1 must be closed to allow operation.

2.6.2 Overview

Optidrive E3 uses a Macro approach to simplify the configuration of the Analog and Digital Inputs. There are two key parameters which determine the input functions and drive behaviour: -

- P-12 Selects the main drive control source and determines how the output frequency of the drive is primarily controlled.
- P-15 Assigns the Macro function to the analog and digital inputs.
- Additional parameters can then be used to further adapt the settings, e.g.
- P-16 Used to select the format of the analog signal to be connected to analog input 1, e.g. 0 10 Volt, 4 20mA
- P-30 Determines whether the drive should automatically start following a power on if the Enable Input is present
- P-31 When Keypad Mode is selected, determines at what output frequency / speed the drive should start following the enable command, and also whether the keypad start key must be pressed or if the Enable input alone should start the drive.
- P-47 Used to select the format of the analog signal to be connected to analog input 2, e.g. 0 10 Volt, 4 20mA

The diagrams below provide an overview of the functions of each terminal macro function, and a simplified connection diagram for each.

Explanation							
Latched Input, Open the contact to STOP the drive							
Latched input, Close the contact to Stort, the drive will operate as long as the input is maintained							
Latched Input, selects the direction of motor rotation FORWARD							
Latched Input, selects the direction of motor rotation REVERSE							
Latched Input, Close to Run in the FORWARD direction, Open to STOP							
Latched Input, Close to Run in the REVERSE direction, Open to STOP							
Hardware Enable Input.							
In Keypad Mode, P-31 determines whether the drive immediately starts, or the keypad start key must be pressed.							
In other modes, this input must be present before the start command is applied via the fieldbus interface.							
Normally Open, Rising Edge, Close momentarily to START the drive (NC STOP Input must be maintained)							
Simultaneously applying both inputs momentarily will START the drive (NC STOP Input must be maintained) Normally Closed, Falling Edge, Open momentarily to STOP the drive							
Normally Open, Rising Edge, Close momentarily to START the drive in the forward direction (NC STOP Input must be maintained)							
Normally Open, Rising Edge, Close momentarily to START the drive in the reverse direction (NC STOP Input must be							
maintained)							
When both inputs are momentarily active simultaneously, the drive stops using Fast Stop Ramp Time P-24							
Normally Closed, Falling Edge, Open momentarily to FAST STOP the drive using Fast Stop Ramp Time P-24							
Normally Closed, External Trip input. When the input opens momentarily, the drive trips showing E-Lr P or PLc-Lh							
depending on P-47 setting							
Activates Fire Mode, see section 2.8.1 Fire Mode							
Analog Input 1, signal format selected using P-16							
Analog Input 2, signal format selected using P-47							
Analog Input 1 provides the speed reference							
Analog Input 2 provides the speed reference							
Speed reference from the selected preset speed							
Preset speeds P-20 – P-23 are used for the speed reference, selected according to other digital input status							
PI Control Speed Reference							
Analog Input used to provide a Feedback signal to the internal PI controller							
Keypad Speed Reference selected							
Normally Open, Close the input to Increase the motor speed							
Normally Open, Close input to Decrease motor speed							
Selected speed reference from Fieldbus (Modbus RTU / CAN / Master depending on P-12 setting)							
Selected speed reference from Fieldbus (Modbus RTU / CAN / Master depending on P-12 setting) Input is Normally Open, Close momentarily to activate the function							
Input is Normally Open, Close momentarily to activate the function

2.7 Motor Control Methods

Optidrive E3 may be used with the following motor types:

- Asynchronous Induction Motors (IM)
- Synchronous Permanent Magnet AC Motors (PM)
- Brushless DC Motors (BLDC)
- Synchronous Reluctance Motors (SynRM)
- Line Start Permanent Magnet Motors (LSPM)

Each motor type requires the correct operating mode to be selected and the correct commissioning procedure to be followed as described in the following sections.

2.7.1 IM Motors

Optidrive E3 factory default parameters are intended for use with IM motors where the power rating of the motor is approximately the same or slightly less than the indicated power rating of the drive. In this case, it should be possible to operate the motor without any parameter adjustment at all for initial testing.

For optimum performance, the drive parameters should be adjusted to match the motor ratings. This will also ensure correct protection of the motor from damage due to overload.

The basic parameters that should be adjusted are:

- P-07: Motor Rated Voltage (V)
- P-08: Motor Rated Current (A)
- P-09: Motor Rated Frequency (Hz)

In addition, it is also possible to set

• P-10: Motor Rated Speed (RPM)

When this parameter is adjusted, slip compensation is activated. Slip compensation attempts to compensate the motor speed relative to the load applied, such that when operating at a constant speed with different loads, the motor shaft speed should remain approximately the same.

To further improve the performance of the motor, the following additional steps can be followed:

- Carry out an Autotune
 - This requires Advanced Parameter Access, P-14 = P-37 + 100 (Default: 201)
 - After the correct nameplate information is entered from the motor, the drive can additionally measure some electrical characteristics of the motor to further optimise the motor control to suit connected motor.
 - This is achieved by setting P-52 = 1
 - The autotune will begin <u>IMMEDIATELY</u> following the setting of this parameter!
 - The drive output will be enabled, and the motor shaft may move. It is important to ensure this is safe before carrying out the autotune.
 - For IM motors, the autotune takes only a few seconds, and measures only the motor stator resistance. Parameter P-55 will be updated with the new value.
- Adjust the Low Frequency Torque Boost
 - o IM motors require some additional voltage at low frequency to improve the low speed operation and torque.
 - By adjusting P-11, it is possible to optimise the low speed operation.
 - o If P-11 is increased too far, excessive motor heating or over current trips may result.

2.7.2 PM Motors

2.7.2.1 Suitable Motor Types

Optidrive E3 provides open loop control of permanent magnet AC motors, intended to allow the use of high efficiency motors in simple applications. Both interior and exterior magnets type motors are supported.

Operation is tested with motors under the following conditions

- The motor Back EMF is >=1 V / Hz
- Maximum motor frequency 360Hz
 Operation down to 10% of rated speed
- RMS Back EMF must not exceed the AC supply voltage during motor operation

It is possible to operate at lower speeds, or with motors with a lower Back EMF / Frequency ratio, however performance may be reduced.

2.7.2.2 Commissioning Procedure

0

When operating with permanent magnet motors, the commissioning steps are as follows:

- Enter the motor Back EMF at Rated Frequency / Speed in parameter P-07
 - This parameter must not be set to the rated motor voltage, but the actual Back EMF imposed by the motor magnets at the drive output terminals.
 - It is sometimes necessary to derive this information from a voltage constant and the rated operating speed, e.g.
 - If a motor has rated speed 2500RPM, back EMF constant 80V / 1000 RPM, P-07 = (2500 * 80) / 1000 = 200V
 Alternatively, obtain the value from the motor supplier, or by direct measurement using an oscilloscope
- Enter the Motor Rated Current in P-08
 - It is possible that excessive current levels may permanently damage the motor, therefore this parameter must be set correctly to ensure this cannot occur.
 - Additionally, this current level is used by the autotune to determine the correct inductance values
- Enter the motor rated frequency in P-09
- Optionally enter the motor rated speed in P-10
- Enabled Advanced Parameter Access by setting P-14 = P-37 + 100 (Default: 201)
- Select PM motor control in by setting P-51 = 2
- Carry out an Autotune
 - $\circ~$ For PM motor operation, an Autotune $\underline{\text{MUST}}$ be carried out
 - This is achieved by setting P-52 = 1
 - \circ ~ The autotune will begin $\underline{\rm IMMEDIATELY}$ following the setting of this parameter!
 - The drive output will be enabled, and the motor shaft may move. It is important to ensure this is safe before carrying out the autotune.
 - For PM motors, the autotune measures the motor stator resistance and both Q and D axis inductance values. Parameters P-55, P-56 and P-57 will be updated following the measurements.
- It should now be possible to operate the motor.
 - Low speed and starting of the motor may be further optimised by adjusting P-11
 - In PM motor control mode, P-11 adjust the additional current injected into the motor at low frequency to help maintain the rotor alignment and ensure reliable starting.

2.7.3 BLDC Motors

Optidrive E3 provides open loop control of BLDC motors, intended to allow the use of high efficiency motors in simple applications. Operation is tested with motors under the following conditions

- The motor Back EMF is >=1 V / Hz
- Maximum motor frequency 360Hz
- Operation down to 10% of rated speed
- RMS Back EMF must not exceed the AC supply voltage during motor operation
- It is possible to operate at lower speeds, or with motors with a lower Back EMF / Frequency ratio, however performance may be reduced.

2.7.3.1 Commissioning Procedure

When operating with permanent magnet motors, the commissioning steps are as follows:

- Enter the motor Back EMF at Rated Frequency / Speed in parameter P-07
 - This parameter must not be set to the rated motor voltage, but the actual Back EMF imposed by the motor magnets at the drive output terminals.
 - It is sometimes necessary to derive this information from a voltage constant and the rated operating speed, e.g.
 - If a motor has rated speed 2500RPM, back EMF constant 80V / 1000 RPM, P-07 = (2500 * 80) / 1000 = 200V
 - o Alternatively, obtain the value from the motor supplier, or by direct measurement using an oscilloscope
- Enter the Motor Rated Current in P-08
 - It is possible that excessive current levels may permanently damage the motor, therefore this parameter must be set correctly to ensure this cannot occur.
 - Additionally, this current level is used by the autotune to determine the correct inductance values
 - Enter the motor rated frequency in P-09
- Optionally enter the motor rated speed in P-10
- Enabled Advanced Parameter Access by setting P-14 = P-37 + 100 (Default: 201)
- Select BLDC motor control in by setting P-51 = 3
- Carry out an Autotune
 - $\circ~$ For BLDC motor operation, an Autotune $\underline{\text{MUST}}$ be carried out
 - This is achieved by setting P-52 = 1
 - The autotune will begin IMMEDIATELY following the setting of this parameter!
 - The drive output will be enabled, and the motor shaft may move. It is important to ensure this is safe before carrying out the autotune.
 - For PM motors, the autotune measures the motor stator resistance and both Q and D axis inductance values. Parameters P-55, P-56 and P-57 will be updated following the measurements.
- It should now be possible to operate the motor.
 - Low speed and starting of the motor may be further optimised by adjusting P-11
 - In BLDC motor control mode, P-11 adjust the additional current injected into the motor at low frequency to help maintain the rotor alignment and ensure reliable starting.

2.7.4 SynRM Motors

2.7.4.1 Suitable Motor Types

Optidrive E3 provides open loop control of Synchronous Reluctance AC motors, intended to allow the use of high efficiency motors in simple applications.

Operation is tested with motors under the following conditions

- Rated voltage 200 400VAC
- 4, 6 and 8 poles
- Maximum motor frequency 100Hz
- Operation down to 10% of rated speed

2.7.4.2 Commissioning Procedure

When operating with synchronous reluctance motors, the commissioning steps are as follows:

- Enter the motor rated voltage in parameter P-07
- Enter the Motor Rated Current in P-08
 - It is possible that excessive current levels may permanently damage the motor, therefore this parameter must be set correctly to ensure this cannot occur.
 - o Additionally, this current level is used by the autotune to determine the correct inductance values
- Enter the motor rated frequency in P-09
- Optionally enter the motor rated speed in P-10
- Enabled Advanced Parameter Access by setting P-14 = P-37 + 100 (Default: 201)
- Select SynRM motor control in by setting P-51 = 4
- Carry out an Autotune
 - For SynRM motor operation, an Autotune <u>MUST</u> be carried out
 - This is achieved by setting P-52 = 1
 - The autotune will begin IMMEDIATELY following the setting of this parameter!
 - The drive output will be enabled, and the motor shaft may move. It is important to ensure this is safe before carrying out the autotune.
 - For SynRM motors, the autotune measures the motor stator resistance and both Q and D axis inductance values. Parameters P-55, P-56 and P-57 will be updated following the measurements.
- It should now be possible to operate the motor.
- Low speed and starting of the motor may be further optimised by adjusting P-11
 - In SynRM motor control mode, P-11 adjust the additional current injected into the motor at low frequency to help maintain the rotor alignment and ensure reliable starting.

2.7.5 LSPM Motors

2.7.5.1 Suitable Motor Types

Optidrive E3 provides open loop control of Line Start Permanent Magnet AC motors, intended to allow the use of high efficiency motors in simple applications. Both interior and exterior magnets type motors are supported. Operation is tested with motors under the following conditions

- The motor Back EMF is >=1 V / Hz
 - Maximum motor frequency 100Hz
 - Operation down to 10% of rated speed
- RMS Back EMF must not exceed the AC supply voltage during motor operation

It is possible to operate at lower speeds, or with motors with a lower Back EMF / Frequency ratio, however performance may be reduced.

2.7.5.2 Commissioning Procedure

0

When operating with LSPM motors, the commissioning steps are as follows:

- Enter the motor Back EMF at Rated Frequency / Speed in parameter P-07.
 - \circ ~ It is preferable to use Back EMF rather than rated voltage as this will improve performance
 - It is sometimes necessary to derive this information from a voltage constant and the rated operating speed, e.g.
 - If a motor has rated speed 2500RPM, back EMF constant 80V / 1000 RPM, P-07 = (2500 * 80) / 1000 = 200V
 Alternatively, obtain the value from the motor supplier, or by direct measurement using an oscilloscope
- Enter the Motor Rated Current in P-08
 - It is possible that excessive current levels may permanently damage the motor, therefore this parameter must be set correctly to ensure this cannot occur.
 - Additionally, this current level is used by the autotune to determine the correct inductance values
- Enter the motor rated frequency in P-09
- Optionally enter the motor rated speed in P-10
- Enabled Advanced Parameter Access by setting P-14 = P-37 + 100 (Default: 201)
- Select LSPM motor control in by setting P-51 = 5
- Carry out an Autotune
 - For LSPM motor operation, an Autotune <u>MUST</u> be carried out
 - This is achieved by setting P-52 = 1
 - o The autotune will begin <u>IMMEDIATELY</u> following the setting of this parameter!
 - The drive output will be enabled, and the motor shaft may move. It is important to ensure this is safe before carrying out the autotune.
 - For LSPM motors, the autotune measures the motor stator resistance and both Q and D axis inductance values. Parameters
 P-55, P-56 and P-57 will be updated following the measurements.
- It should now be possible to operate the motor.
- Low speed and starting of the motor may be further optimised by adjusting P-11
 - In LSPM motor control mode, P-11 adjust the additional current injected into the motor at low frequency to help maintain the rotor alignment and ensure reliable starting.

2.8 Software Functions

2.8.1 Fire Mode

The Fire Mode function is designed to ensure continuous operation of the drive in emergency conditions until the drive is no longer capable of sustaining operation. The Fire Mode input may be a normally open (Close to Activate Fire Mode) or Normally Closed (Open to Activate Fire Mode) according to the setting of P-30 Index 2. In addition, the input may be momentary or maintained type, selected by P-30 Index 3. This input may be linked to a fire control system to allow maintained operation in emergency conditions, e.g. to clear smoke or maintain air quality within that building.

The fire mode function is enabled when P-15 = 15, 16 or 17, with Digital Input 3 assigned to activate fire mode.

Fire Mode disables the following protection features in the drive: -

- O-t Heat-sink Over-Temperature
- U-t Drive Under Temperature
- Th-FLt Faulty Thermistor on Heat-sink
- E-trip External Trip
- 4-20 F 4-20mA fault
- Ph-Ib Phase Imbalance
- P-Loss Input Phase Loss Trip
- SC-trp Communications Loss Trip
- It-trp Accumulated overload Trip
- Out-F Drive output fault, Output stage trip

The following faults will result in a drive trip, auto reset and restart: -

- O-Volt Over Voltage on DC Bus
- U-Volt Under Voltage on DC Bus
- h O-I Fast Over-current Trip
- O-I Instantaneous over current on drive output

2.8.2 OEM / User Default Parameters

Optidrive E3 includes an embedded function to allow the user to create their own "default" parameters. This means that if a factory reset is carried out, the drive will return to these parameters, as opposed to the Invertek Drive factory default parameters.

This feature is accessed using Optitools Studio PC software only, which may be freely downloaded from the Invertek Drives website.

2.8.2.1 Creating the default parameter set

In order to create the User Default settings, the following process should be used.

OptiTools Studio					<u>—</u>		×	In Optitools Studio, ensure

The confirmation message will appear to show the user defaults are now cleared and resetting the drive will return it to Invertek Drives Factory default settings.

Optidrive E3 Parameter Set Overview

2.8.3 Automatic Switching Frequency Reduction

2.8.3.1 Heatsink Temperature Based Effective Switching Frequency Reduction

When the drive heatsink temperature exceeds preset threshold values, the output Effective Switching Frequency is automatically reduced below the value selected in P-17 to reduce the risk of over temperature trip. The threshold levels are shown in section 7.1 Thermal Management on page 53.

2.8.3.2 Output Frequency based Effective Switching Frequency Reduction

At low output frequency, Effective Switching Frequency is automatically reduced. Hysteresis is applied to prevent continuous switching. The operation is according to the following table:

P-17	32kHz	24kHz	16kHz	12kHz	8kHz	4kHz
Effective Switching Frequency increases when Output Frequency exceeds	9.0Hz	7.0Hz	5.0Hz	3.0Hz	N/A	N/A
Effective Switching Frequency reduces when Output Frequency reduces below	7.0Hz	5.0Hz	3.0Hz	1.0Hz	N/A	N/A

2.8.3.3 Output Current Based Effective Switching Frequency Reduction

Effective Switching Frequency is automatically reduced based on motor load current as follows:

- All ODE-3-240095-3F4# models:
 - If P-17 = 12kHz, 16kHz, 24kHz, Effective switching frequency is reduced to 8kHz when motor current exceeds 10.45A (110% of the drive rated current). Switching frequency will return to the value set in P-17 when motor current reduces below 7.6A (80% of drive rated current)
 - If P-17 = 32kHz, Effective switching frequency is reduced to 8kHz when motor current exceeds 10.45A (110% of drive rated current). Switching frequency changes to 24kHz when motor current reduces below 7.6A (80% of drive rated current). Switching frequency will return to the value set in P-17 when motor current reduces below 6.7A (70% of drive rated current)
- All other models:
 - Effective switching frequency is reduced to 8kHz when motor current exceeds 140% of the drive rated current. Switching frequency will return to the value set in P-17 when motor current reduces below 110% of drive rated current.

2.8.4 Output Frequency Change by Fixed Step

From firmware version 3.08 a new feature is introduced which allows the output frequency and hence motor speed to be changed by a fixed step each time an increase or decrease request is received at the digital inputs.

This speed control method is active only under the following conditions:

- P-12 = 1 or 2 (Motorised Pot Speed Reference)
- P-15 = 14

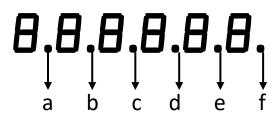

With the parameter settings, digital inputs 2 and 4 operate as follows:

- Digital Input 2: Speed Step Up
 - Each time a rising edge pulse is received at the digital input, the output frequency or motor speed is increased by the amount set in P-20 Preset Speed 1
 - Digital Input 4: Speed Step Down
 - Each time a rising edge pulse is received at the digital input, the output frequency or motor speed is decreased by the amount set in P-20 Preset Speed 1
 - A single speed step is applied for each rising edge at the digital input
 - Minimum on time for the pulse recommended as 20ms
 - If pulses are applied simultaneously to both inputs, the speed step is not applied
 - Using the keypad or remote keypad Up and Down buttons has no effect
 - All other operation is as per Keypad Mode.

2.9 LED Display

Optidrive E3 has a built in 6 Digit 7 Segment LED Display. In order to display certain warnings, the following methods are used: -

2.9.1 LED Display Layout

2.9.2 LED Display Meanings

LED Segments	Behaviour	Meaning
a, b, c, d, e, f	Flashing all together	Overload, motor output current exceeds P-08
a and f	Flashing alternately	Mains Loss (Incoming AC power has been removed)
а	Flashing	Fire Mode Active

3 Drive Model Specific Parameter Variations

3.1 Available Effective Switching Frequency Options

110 Volt	110 Volt, 1 Phase Models (Voltage Doubler)							
Frame	kW	HP	Default	Minimum	Maximum

4 Fieldbus Interface Support

4.1 Fieldbus Support Overview

Optidrive E3 provides support for the following fieldbus networks and functions

Fieldbus	Interface	Drive Control	Drive Parameter Access		
Modbus RTU	On-board RJ45	Yes	Access to all Writable Parameters		
CAN bus	On-board RJ45	Yes	Access to all Writable Parameters		

4.2 Modbus RTU

Optidrive E3 supports Modbus RTU communication, using the 03 Read Holding Registers and 06 Write Single Holding Register commands. Many Master devices treat the first Register address as Register 0; therefore it may be necessary to convert the register numbers listed below by subtracting 1 to obtain the correct Register address. The telegram structure is as follows: -

Command 03 – Read Holding Registers						
Master Telegram	Le	Length		Slave Response	Le	ngth
Slave Address	1	Byte		Slave Address	1	Byte
Function Code (03)	1	Byte		Starting Address	1	Byte
1 st Register Address	2	Bytes		1 st Register Value	2	Bytes
No. Of Registers	2	Bytes		2 nd Register Value	2	Bytes
CRC Checksum	2	Bytes		Etc		
]	CRC Checksum	2	Bytes

Command 06 – Write Single Holding Register						
Master Telegram	Length			Slave Response	Le	ngth
Slave Address	1	Byte		Slave Address	1	Byte
Function Code (06)	1	Byte		Function Code (06)	1	Byte
Register Address	2	Bytes		Register Address	2	Bytes
Value	2	Bytes		Register Value	2	Bytes
CRC Checksum	2	Bytes		CRC Checksum	2	Bytes

The table shows the Modbus RTU register number corresponding to each parameter value. All values are holding registers.

All User Adjustable parameters are accessible by Modbus, except those that would directly affect the Modbus communications, e.g.

- P-36 Index 1 Drive Fieldbus Address
- P-36 Index 2 Baud Rate
- P-36 Index 3 Comms Loss Timeout

All parameter values can be read from the drive and written to, depending on the operating mode of the drive – some parameters cannot be changed whilst the drive is enabled for example.

4.3 Profibus DP

Profibus DP communication is supported through an external gateway. Operation is explained further in section 5 Fieldbus Gateways on page 44.

4.4 DeviceNet

DeviceNet communication is supported through an external gateway. Operation is explained further in section 5 Fieldbus Gateways on page 44.

4.5 CAN

The CAN communication profile in the Optidrive E3 is implemented according to the specification DS301 version 4.02 of CAN in automation (www.can-cia.de). Specific device profiles such as DS402 are not supported.

The CAN communication function is enabled by default after power up. However, in order to use any control functions through CAN, this requires P-12 = 7 or 8.

The CAN communication baud rate can be set by using parameter P-36. Available baud rates are: 125kbps, 250kbps, 500kbps, 1Mbps. (with default settings as 500kbps).

The Node ID is set up through drive address parameter P-36 as well with the default value of 1.

The tables below show the Index and Sub Index required to address each parameter. All User Adjustable parameters are accessible by CAN, except those that would directly affect the communications.

All parameter values can be read from the drive and written to, depending on the operating mode of the drive – some parameters may be changed whilst the drive is enabled for example.

Optidrive E3 provides the following default COB-ID and functions:

Туре	COB-ID	Function
NMT	000h	Network management
Sync	080h	Synchronous message
		COB-ID can be configured to other value.
Emergency	080h + Node address	Emergency message
PDO1 (TX)	180h + Node address	Process data object.
PDO1 (RX)	200h + Node address	PDO1 is pre-mapped and enabled by default.
PDO2 (TX)	280h + Node address	COB-ID can be configured to other value.
PDO2 (RX)	300h + Node address	PDO2 is pre-mapped and disabled by default.
		Transmission mode, COB-ID and mapping can be configured.
SDO (TX)	580h + Node address	SDO channel can be used for drive parameter access.
SDO (RX)	600h + Node address	
Error Control	700h + Node address	Guarding and Heartbeat function are supported.
		COB-ID can be configured to other value.

4.5.1.1 Note

- The Optidrive E3 SDO channel only supports expedited transmission.
- The Optidrive E3 can only support up to 2 Process Data Objects (PDO). All PDOs are pre-mapped; however, PDO2 is disabled by default. The table below gives the default PDO mappi VICPAS

• Customer configuration (mapping) will <u>NOT</u> be saved during power down. This means that the CAN configuration will restore to its default condition each time the drive is powered up.

4.5.2 PDO Default Mapping

	Objects No.	Mapped Object	Length	Mapped Function	Transmission Type	
	1	2000h	Unsigned 16	Control command register*		
RX	2	2001h	Integer 16 Speed reference		254	
PDO1	3	2003h	Unsigned 16	User ramp reference	Valid immediately	
	4	0006h	Unsigned 16	Dummy	1	
	1	200Ah	Unsigned 16	Drive status register	254 Send after receiving RX PDO 1	
ТΧ	2	200Bh	Integer 16	Motor speed Hz		
PDO1	3	200Dh	Unsigned 16	Motor current		
	4	2010h	Integer 16	Drive temperature	TA PDU I	
	1	0006h	Unsigned 16	Dummy		
RX	2	0006h	Unsigned 16	Dummy	254	
PDO2	3	0006h	Unsigned 16	Dummy	254	
	4	0006h	0006h Unsigned 16 Dummy]	
	1	2011h	Unsigned 16	DC bus voltage		
ΤХ	2	2012h	Unsigned 16	Digital input status	254	
PDO2	3	2013h	Integer 16	Analog input 1 (%)	254	
	4	2014h	Integer 16	Analog input 2 (%)		

* Drive control can only be achieved when P-12=7 or 8 provided that P-31 = 0, 1, 4 or 5.

4.5.3 PDO transmission type

Various transmission modes can be selected for each PDO. For RX PDO, the following modes are supported: -

Transmission Type Mode		Description			
0-240	Synchronous	The received data will be transferred to the drive active control			
		register when the next sync message is received.			
254, 255	Asynchronous	The received data will be transferred to the drive active contro register immediately without delay.			

For TX PDO, the following modes are supported: -

Transmission Type Mode		Description		
0 Acyclic synchronous		TX PDO will only be sent out if the PDO data has changed and		
		PDO will be transmitted on reception of SYNC object		
1-240	Cyclic synchronous	TX PDO will be transmitted synchronously and cyclically. The		
		transmission type indicates the number of SYNC object that are		
254	Asynchronous	TX PDO will only be transferred once corresponding RX PDO has		
		been received.		
255	Asynchronous	TX PDO will only be transferred anytime if PDO data value has		
		changed.		

4.5.4 CAN Specific Object Table	?

4.6 **Parameter Access Overview**

The accessible parameter numbers and respective scaling are listed in the following tables. The method to access the parameters depends on the fieldbus type in use as described in the following section.

The R/W column indicates whether the values are Writeable as well as readable (R/W) or Read Only (R)

The data types for the parameter are defined as follows: -

WORD Hexadecimal Word Unsigned 16 Bit Value U16

S16

Signed 16 Bit Value

4.7 Additional Information

4.7.1 Drive Control Word Format

0			0.4.10													
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
				High	byte							Lov	v byte			

Bit 0: Run/Stop command: Set to 1 to enable the drive. Set to 0 to stop the drive.

Bit 1: Fast stop request. Set to 1 to enable drive to stop with 2nd deceleration ramp.

Bit 2: Reset request. Set to 1 in order to reset the drive if drive is under trip condition.

User must clear this bit when drive is under normal condition to prevent un-expected reset.

Bit 3: Coast stop request. Set to 1 to issue a coast stop command.

For normal operation, Bit 3 has the highest priority, bit 0 has the lowest priority (bit 3>bit 1>bit 0). For example, if user set command as 0x0009, drive will do a coast stop rather than run. For normal run/start, just set this register to 1.

Note that stat/stop (bit 0), fast stop (bit 1) and coast stop (bit 3) only works if P-31= 0 or 1. Otherwise, start/stop function is controlled by drive control terminals. Reset function (bit 2) works all the time as long as the drive is operated under Modbus control mode (P-12=3 or 4).

4.7.2 Speed Reference Format (Standard resolution)

Speed reference value is transferred with one decimal place (200 = 20.0Hz). The maximum speed reference value is limited by P-01. Either register 2 or register 5 can be used for speed reference control, however only one reference should be used in any control system, otherwise unexpected behaviour can result.

4.7.3 Acceleration / Deceleration Ramp Time

Active only when P-12 = 4, this register specifies the drive acceleration and deceleration ramp time. The same value is applied simultaneously to the acceleration and deceleration ramp times. The value has two decimal places, e.g. 500 = 5.00 seconds.

4.7.4 High Resolution Speed Reference

This register allows the user to set the speed reference value in the internal format, e.g. 3000 = 50.0Hz. This allows control resolution to 1 RPM with a 2-pole motor. The maximum allowed value is limited by P-01.

ICPAS

Either register 2 or register 5 can be used for speed reference control, however only one reference should be used in any control system, otherwise unexpected behaviour can result.

4.7.5 Drive status and error code Word

High byte gives drive error code. (Valid when the drive is tripped, see 0 for further details)

Low byte gives drive status information as follows: -

Bit 0: 0 = Drive Stopped, 1 = Drive Running

- Bit 1: 0 = OK, 1 = Drive Tripped
- Bit 5: 0 = OK, 1 = In Standby Mode

Bit 6: 0 = Not Ready, 1 = Drive Ready to Run (not tripped, hardware enabled and no mains loss condition)

4.7.6 Scope Channel Data Values

These registers show the scope present data sample value for the first two scope channels. The channel data source selection is carried out through Optitools Studio.

4.7.7 Modbus RTU Registers 25 - 28: Drive Serial Number

The drive serial number may be read using these four registers. The serial number has 11 digits, stored as follows: -

Regis	ter 28		Regis	ter 27		Regis	ter 26		Register 25	
х	х	х	х	х	х	х	х	х	х	x
eр										

e.g.											
Register 25	1	L									
Register 26	1	L									
Register 27	87	45									
Register 28	57										
Drive Serial Number	5	7	8	7	4	5	0	1	0	0	1

4.7.8 Start Mode, Auto Restart & Fire Mode Configuration (P-30)

This parameter contains 3 values, stored as follows: -

High By	te							Low By	te						
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Input Ty	ype			Input Se	ense			Start M	ode / Aut	o Restart	as: -				
0: Cons): Constant I: Momentary Start				nally Close	ed (Open	Fire	0: Edge	-r						
1: Mom	L: Momentary Start Mode)							1: Auto	-0						
	1: Momentary Start			1: Norm	nally Oper	n (Closed	Fire	2: Auto	-1						
				Mode)				3: Auto	-2						
								4: Auto	-3						
							5: Auto	-4							
								6: Auto	-5						

4.7.9 DC Injection Configuration (P-32)

The parameter value is stored as a combined 16-bit word which is constructed as follows: -

High B	yte							Low By	te						
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DC Inje	ection Mo	de						DC Inje	ction Dur	ation: 1d	p, e.g. 0 –	250 = 0.0	– 25.0s		
0: DC I	njection o	n Start													
1: DC I	njection o	n Stop													
2: DC I	njection o	n Start &	Stop												

4.7.10 Communications Configuration (P-36)

This Register entry contains multiple data entries, as follows: -

Hi	High Byte								Low By	te				
15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0														
Tri	Trip Configuration Baud Rate							Drive A	ddress					

Data values can be interpreted as follows: -

		led as follows: -	
Drive Address	1 to 63		
Baud Rate	Setting	Modbus RTU	CAN
	0	115k2	500
	1	115k2	500
	2	9k6	500
	3	19k2	500
	4	38k4	500
	5	57k6	500
	6	115k2	500
	7	115k2	125
	8	115k2	250
	9	115k2	500
	10	115k2	1000
Trip Time Set-up	0	Comms Loss Trip Disabled	
	1	30ms Watchdog, Trip on Com	ims Loss
	2	300ms Watchdog, Trip on Co	mms Loss
	3	1000ms Watchdog, Trip on Co	omms Loss
	4	3000ms Watchdog, Trip on Co	omms Loss
	5	30ms Watchdog, Ramp to Sto	op on Comms Loss
	6	300ms Watchdog, Ramp to Si	top on Comms Loss
	7	1000ms Watchdog, Ramp to	Stop on Comms Loss
	8	3000ms Watchdog, Ramp to	Stop on Comms Loss

4.7.11 Display Scaling (P-40)

The parameter value is stored as a combined 16-bit word which is constructed as follows: -

High Byte								Lov	v Byt	e					
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Display Scaling So	urce	Disp	lay Sca	aling Fa	actor:	3dp, (e.g. 0	- 16	000 =	0.00	0-1	6.000)		
0: Motor Speed															
1: Motor Current	•														
2: Analog Input 2															
3: PI Feedback															

4.7.12 Parameter Checksum Modbus Register 46

A checksum is calculated based on the present value of all user adjustable parameters and stored in Modbus Register 46. This may be read to determine if parameter settings have been adjusted.

4.8 Modbus RTU Indirect Parameter Access

Optidrive E3 allows Read / Write access to all user adjustable parameters using a simple method as detailed below. This is achieved using the following two Modbus registers.

4.8.1.1 Register 44: Drive parameter index

This index value will be used by register 45 to carry out parameter read and write function. The valid range of this parameter is from 1 to 60 (maximum number of drive user adjustable parameters)

4.8.1.2 Register 45: Drive parameter value

When reading this register, the value represents the drive parameter value which index is specified by register 44. When writing to this register, the value will be written to the drive parameter number specified by register 44.

4.8.2 Parameter Read Method

In order to read a parameter, firstly write the parameter number to register 44, then read the value from register 45, e.g. to Read the Value of P-01

- Write 1 to Register 44
- Read the Value of Register 45

4.8.3 Parameter Write Method

Writing parameter values can be achieved by the same method, however, register 45 is used to write the parameter value <u>after</u> the parameter number has been selected using Register 44, e.g. to Write a Value of 60.0Hz to parameter P-01

- Write 1 to Register 44
- Register 45 will return the present value of P-01, which can be Read if required
- Referring to the parameter table shown in 4.6.2, apply any scaling necessary

 In this case, 60.0Hz = 3600
- Write the scaled value to Register 45. P-01 now changes to 60.0Hz, or an exception code may be returned.

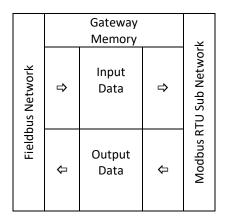

5 Fieldbus Gateways

5.1 Gateway Concept

The fieldbus gateway acts as an interface between the Modbus RTU interface embedded into the Optidrive E3, and a high-level fieldbus network such as Profibus DP or DeviceNet. The gateway supports multiple drive connection up to 8 drives, providing a cost-effective method to connect Optidrive E3 units to a Profibus network.

The gateway internally consists of two segments of memory. Data transferred from the fieldbus Master System is written to the first memory area, and the fieldbus Master may Read data from the second memory area.

The fieldbus Master can normally be configured to Read and Write the entire gateway memory area in a single transaction, or separate transaction per drive may be configured. The gateway is the pre-configured by Invertek to carry out the necessary individual Modbus RTU transactions to communicate with the Sub Network of connected drives.

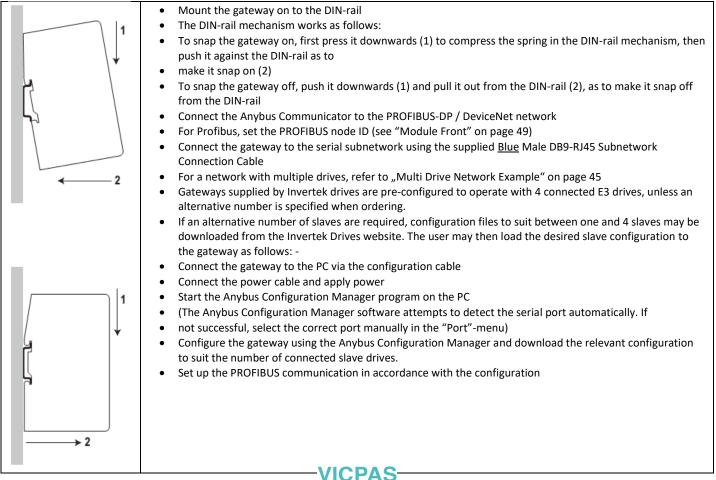

5.2 Gateway Included Components

Each gateway is supplied with the following: -

- Anybus Communicator Profibus AB7000 OR Anybus Communicator DeviceNet AB7001
- Anybus Communicator Resource CD (Includes configuration software, manuals, GSD / EDS file and application notes)
- Female DB9-RJ10 Black RS232 configuration cable
- Male DB9-RJ45 Blue Subnetwork Connection Cable

Note: PROFIBUS / DeviceNet network cable and connector are not included.

5.3 Gateway Installation

5.4 Subnetwork Connection

The drive sub network connects to the connector on the bottom of the gateway, using the supplied DB9-RJ45 cable. For a single drive installation, the cable can be connected directly from the gateway to the Optidrive. For a network of multiple drives, the network can be easily constructed using suitable RJ45 cables and splitters available from your Invertek Drives Sales Partner.

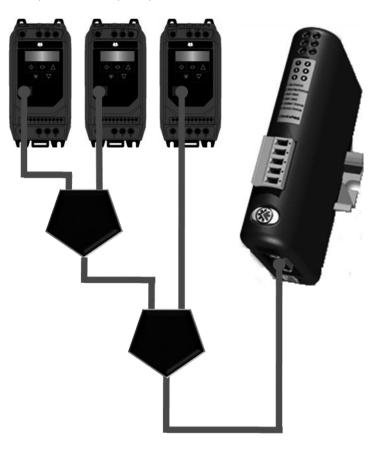

5.4.1 Single Drive Network Example

The gateway is connected to the drive using the supplied Blue Male DB9-RJ45 Subnetwork Connection Cable.

5.4.2 Multi Drive Network Example

The network can be constructed using firstly the supplied Blue Male DB9-RJ45 Subnetwork Connection Cable, and in addition, RJ45 Splitters (OPT-2-J45SP-IN) and RJ45 cables (0.5m – OPT-2J\$505-IN, 1m – OPT-J4510-IN, 3m – OPT-2-J4530-IN). Alternative cables may be used; Invertek recommend using Cat 6 shielded twisted pair cables with pin to pin construction.

5.5 Commissioning Drive Parameter Settings

5.5.1 P-36 Communication Configuration

The Optidrive communication parameters are set using P-36, which has three indices as follows: -

P-36	Serial Communications Configuration					
	Index 1: Address					
	Range: 0 – 63, default: 1					
	For a single drive network, the address must be set to 1.					
	For multiple drives, the addresses must be set sequentially starting from 1.					
Index 2: Baud Rate						
	Selects the baud rate and network type for the internal RS485 communication port.					
	When using the gateway, the baud rate must be set to 57.6kbps.					
	Index 3: Communication loss protection					
	Defines the time for which the drive will operate without receiving a valid command telegram to Register 1 (Drive Control Word)					
	after the drive has been enabled. Setting 0 disables the Watchdog timer. Setting a value of 30, 100, 1000, or 3000 defines the time					
	limit in milliseconds for operation. A 'D' suffix selects trip on loss of communication. An 'r' suffix means that the drive will coast stop					
	(output immediately disabled) but will not trip.					

5.5.2 P-12 Command Source Selection

Modbus RTU is always enabled on Optidrive E3, allowing the gateway to provide remote monitoring of the drive by a remote Profibus Master device regardless of the control configuration of the drive.

If it is desired to control the drive from the Profibus network, P-12 must be set as follows: -

P-12	Primary Command Source	0	9	0	-					
	3: Modbus Network Control. Control via the fieldbus using the internal Accel / Decel ramps (P-03 / P-04)									
	4: Modbus Network Control. Control via the fieldbus with Accel / Decel ramps	updated via N	/lodbus							

5.6 Gateway Memory Mapping

The PLC programmer can read/write the PLC memory mapping to gateway memory in order to monitor/control drives in the sub network.

5.6.1 Input memory

This part of the memory contains the real-time drive information that can be read by the PLC.

	Data	Start	Data	Data		Description
Drive	Data	Address	Length	Range	Unit	Description
	Trip code	0x0000	8 bits	0 to 11		Refer to drive User Guide
	Drive status	0x0001	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
1	Motor speed in Hz	0x0002	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
-	Motor current	0x0004	16 bits	0 to 10000	Α	One decimal place (76 = 7.6A)
	Not Used	0x0006	16 bits	-	-	
	Trip code	0x0008	8 bits	0 to 11		See error code list for further information
	Drive status	0x0009	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
2	Motor speed in Hz	0x000A	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
	Motor current	0x000C	16 bits	0 to 10000	А	One decimal place (76 = 7.6A)
	Not Used	0x000E	16 bits	-	-	
	Trip code	0x0010	8 bits	0 to 11		See error code list for further information
	Drive status	0x0011	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
3	Motor speed in Hz	0x0012	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
	Motor current	0x0014	16 bits	0 to 10000	Α	One decimal place (76 = 7.6A)
	Not Used	0x0016	16 bits	-	-	
	Trip code	0x0018	8 bits	0 to 11		See error code list for further information
	Drive status	0x0019	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
4	Motor speed in Hz	0x001A	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
	Motor current	0x001C	16 bits	0 to 10000	А	One decimal place (76 = 7.6A)
	Not Used	0x001E	16 bits	-	-	
	Trip code	0x0020	8 bits	0 to 11		See error code list for further information
	Drive status	0x0021	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
5	Motor speed in Hz	0x0022	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
	Motor current	0x0024	16 bits	0 to 10000	А	One decimal place (76 = 7.6A)
	Not Used	0x0026	16 bits	-	-	
	Trip code	0x0028	8 bits	0 to 11		See error code list for further information
	Drive status	0x0029	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
6	Motor speed in Hz	0x002A	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
	Motor current	0x002C	16 bits	0 to 10000	А	One decimal place (76 = 7.6A)
	Not Used	0x002E	16 bits	-	-	
	Trip code	0x0030	8 bits	0 to 11		See error code list for further information
	Drive status	0x0031	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
7	Motor speed in Hz	0x0032	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
	Motor current	0x0034	16 bits	0 to 10000	Α	One decimal place (76 = 7.6A)
	Not Used	0x0036	16 bits	-	-	,
	Trip code	0x0038	8 bits	0 to 11		See error code list for further information
	Drive status	0x0039	8bits	0, 1, 2,		Refer to Drive Status Word on page 48
8	Motor speed in Hz	0x003A	16 bits	-P-01 to P-01	Hz	One decimal place (500 = 50.0Hz)
	Motor current	0x003C	16 bits	0 to 10000	Α	One decimal place (76 = 7.6A)
	Not Used	0x003E	16 bits	-	-	, , , ,

5.6.2 Output memory

This part of the memory contains the control command information to allow the PLC to control the drives.

Drive	Data	Start Address	Data Length	Data Range	Unit	Description
	Control command	0x0200	16 bits	-		Refer to Drive Control Word on page 48
1	Speed reference in HZ	0x0202	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
1	No Function	0x0204	16 bits			
	Ramp Time	0x0206	16 bits	0 - 60000	S	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps
	Control command	0x0208	16 bits	-		Refer to Drive Control Word on page 48
2	Speed reference in HZ	0x020A	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
2	No Function	0x020C	16 bits			
	Ramp Time	0x020E	16 bits	0 - 60000	S	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps
	Control command	0x0210	16 bits	-		Refer to Drive Control Word on page 48
3	Speed reference in HZ	0x0212	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
5	No Function	0x0214	16 bits			
	Ramp Time	0x0216	16 bits	0 - 60000	s	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps
	Control command	0x0210	16 bits	-		Refer to Drive Control Word on page 48
4	Speed reference in HZ	0x0212	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
4	No Function	0x0214	16 bits			
	Ramp Time	0x0216	16 bits	0 - 60000	s	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps
	Control command	0x0220	16 bits	-		Refer to Drive Control Word on page 48
5	Speed reference in HZ	0x0222	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
5	No Function	0x0224	16 bits			
	Ramp Time	0x0226	16 bits	0 - 60000	s	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps
	Control command	0x0228	16 bits	-		Refer to Drive Control Word on page 48
6	Speed reference in HZ	0x022A	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
0	No Function	0x022C	16 bits			
	Ramp Time	0x022E	16 bits	0 - 60000	S	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps
	Control command	0x0230	16 bits	-		Refer to Drive Control Word on page 48
7	Speed reference in HZ	0x0232	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
,	No Function	0x0234	16 bits			
	Ramp Time	0x0236	16 bits	0 - 60000	S	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps
	Control command	0x0230	16 bits	-		Refer to Drive Control Word on page 48
8	Speed reference in HZ	0x0232	16 bits	-P-01 to P-01	Hz	Drive digital speed reference. Including one decimal place. (500 = 50.0Hz)
5	No Function	0x0234	16 bits			
	Ramp Time	0x0236	16 bits	0 - 60000	S	Ramp time in seconds x 100 (250 = 2.5s) simultaneously applied to acceleration and deceleration ramps

5.6.3 Drive Control Word

The drive Control Word format is the same as used for Modbus RTU, explained in section 4.7.1 Drive Control Word Format on page 41.

5.6.4 Drive Status Word

The drive Status Word format is the same as used for Modbus RTU, explained in section 4.7.5 Drive status and error code Word on page 42.

5.7 Controlling the Optidrive(s)

The following points should be noted when attempting to control the Optidrive(s): -

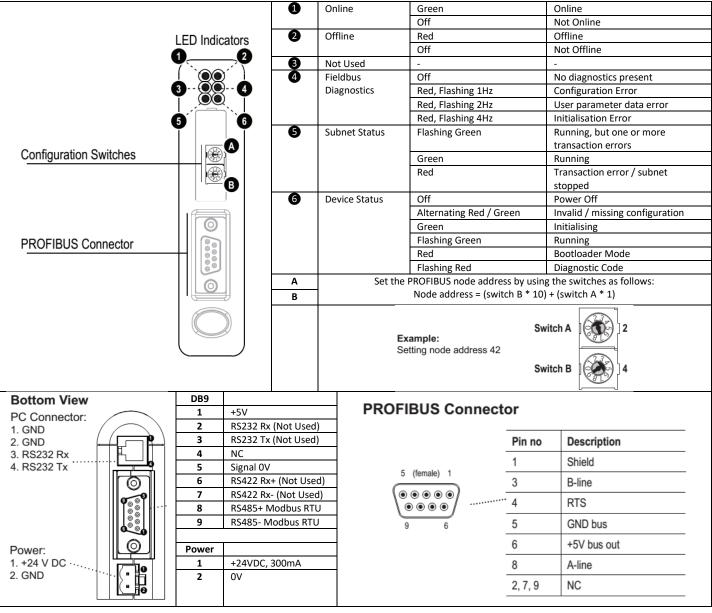

- The drive must be set for Modbus RTU control using P-12
- Digital Input, which acts as a hardware enable must be ON in order for the drive to start, otherwise the drive will not enable, and the Sub Network Status LED will illuminate Red when the user tries to start the drive.
- The Enable / Run signal is Edge triggered, and so the drive must receive a control word with Bit 0 = 0, followed by a control word with Bit 0 = 1 in order to start.
- If P-12 = 3 and the user writes any data to the Ramp Time memory area, the gateway will indicate a Sub Network Status error (red flash), as the drive rejects the data which cannot be used.

5.8 Profibus DP Gateway Features – OD-PROFB-IN

- Complete PROFIBUS-DP slave functionality according to IEC 61158
- Supports all common baud rates up to 12 Mbit (detected automatically)
- Up to 64 bytes of I/O data in each direction, allowing up to 8 Optidrives to be connected to a single gateway.
- Galvanically isolated bus electronics

5.8.1 Installation

5.8.1.1 Overview - Module Front

5.8.2 Profibus Master Configuration

The latest applicable GSD file may be downloaded from the HMS website, www.anybus.com.

The actual configuration process will differ for different Profibus Master Systems and is not possible to explain in this document. Example configurations for Siemens PLC are provided on the HMS website.

When configuring the communication between the Master System and the gateway, 4 words of Input Process Data and 4 words of Output Process Data should be allocated per drive connected the gateway, up to a maximum of 32 Input and Output words. If necessary, a configuration may be chosen in the Profibus Master which supports more than the connected number of drives, e.g. if 3 drives are connected to the gateway, the Master System can be configured for 12, 16 or even 32 words of Input and Output process data. The additional words will simply not contain any data.

Fieldbus Gateways

5.9 DeviceNet Gateway Features – OD-DEVNT-IN

- Communications Adapter, profile no. 12
- Group two server
- MacID and baud rate configuration via on-board switches
- Polled, Change-of-state and Bit strobed I/O

5.9.1 Installation

5.9.2 DeviceNet Master Configuration

The latest version of the EDS file may be downloaded from the HMS website, www.anybus.com.

The actual configuration process will differ for different DeviceNet Master Systems and is not possible to explain in this document. Example configurations for Rockwell PLC are provided on the HMS website.

When configuring the communication between the Master System and the gateway, 4 words of Input Process Data and 4 words of Output Process Data should be allocated per drive connected the gateway, up to a maximum of 32 Input and Output words. If necessary, a configuration may be chosen in the Master which supports more than the connected number of drives, e.g. if 3 drives are connected to the gateway, the Master System can be configured for 12, 16 or even 32 words of Input and Output process data. The additional words will simply not contain any data.

5.10 Diagnostics and Troubleshooting

0	5
Symptom	Suggested Actions
No Communication,	Check all network cables
Master > Gateway	Check correct bus termination
	Check correct node address on gateway
	Check GSD / EDS file is recognised and used by the Master
	Check the Status LEDs 1 and 2
Profibus Communication	Check the subnetwork Status LED
ОК,	Check all sub network connections
Not possible to control	Check correct baud rate set in drives
the Optidrive(s)	Check drives are addressed sequentially from 1
	Check that data is written to the correct memory area(s)

6 Diagnostic and Fault Messages

6.1 Fault Messages

Fault	No.	Description
Code	_	
no-Flt	00	No Fault
OI-b	01	Brake channel over current
OL-br	02	Brake resistor overload
0-1	03	Instantaneous over current
l.t-trp	04	Motor Thermal Overload (I2t)
O-Volt	06	Over voltage on DC bus
U-Volt	07	Under voltage on DC bus
0-t	08	Heatsink over temperature
U-t	09	Under temperature
P-dEF	10	Factory Default parameters have been loaded
E-trip	11	External trip
SC-ObS	12	Optibus comms loss
FLt-dc	13	DC bus ripple too high
P-LOSS	14	Input phase loss trip
h O-I	15	Instantaneous over current on drive output.
th-Flt	16	Faulty thermistor on heatsink.
dAtA-F	17	Internal memory fault. (IO)
4-20 F	18	4-20mA Signal Lost
dAtA-E	19	Internal memory fault. (DSP)
U-dEF	20	User Default Parameters Loaded
F-Ptc	21	Motor PTC thermistor trip
FAN-F	22	Cooling Fan Fault
O-hEAt	23	Environmental temperature too high
Out-F	26	Drive output fault
AtF-01	40	Measured motor stator resistance varies between phases.
AtF-02	41	Measured motor stator resistance is too large.
AtF-03	42	Measured motor inductance is too low.
AtF-04	43	Measured motor inductance is too large.
Out-Ph	44	Output (motor) phase missing
Out-Ph	49	Output (Motor) phase loss
SC-F01	50	Modbus comms loss fault
SC-F02	51	CAN comms loss trip

6.2 Resetting a Fault

When the drive trips, and a fault message is displayed, it can be reset in one of the following ways: -

- Completely remove the incoming power supply and allow the power to dissipate completely. Re-apply the power.
 - Remove and reapply the enable input
 - Press the stop / Reset button
 - If Modbus or CAN are in use, set the reset bit in the control word from 0 to 1

In the event of O-I, hO-I or I.t-trp faults, in order to prevent damage that may occur through repeatedly enabling the drive into a fault condition, these trips cannot be reset immediately. A delay time according to the following table must be allowed before reset is possible.

First Trip	2 seconds delay before reset is possible
Second Trip	4 seconds delay before reset is possible
Third Trip	8 seconds delay before reset is possible
Fourth Trip	16 seconds delay before reset is possible
Fifth Trip	32 seconds delay before reset is possible
Subsequent Trips	64 seconds delay before reset is possible

7 Rated Temperatures and De-rating curves

7.1 Thermal Management

The Optidrive E3 product range has an integrated Thermal Management function. This function allows the drive to automatically reduce the drive output switching frequency when operating at higher heatsink temperatures to avoid the risk of an over temperature trip. The tables below show the heatsink temperature threshold points at which thermal management occurs.

NOTE

The available range of switching frequencies is subject to the drive frame size, power rating and voltage rating. Refer to section 3.1 Available Effective Switching Frequency Options for further information.

7.1.1 IP20 Drives

Temperature Threshold	Action
70 °C	Auto reduce from 32kHz to 24kHz
75 ^o C	Auto reduce from 24kHz to 16kHz
80 ^o C	Auto reduce from 16kHz to 12kHz
85 ^o C	Auto reduce from 12kHz to 8kHz
90 ^o C	Auto reduce from 8kHz to 4kHz
97 ^o C	Over temp trip

7.1.2 IP66 Drives

Temperature Threshold	Action
70 °C	Auto reduce from 32kHz to 24kHz
75 ^o C	Auto reduce from 24kHz to 16kHz
80 ⁰ C	Auto reduce from 16kHz to 12kHz
85 ^o C	Auto reduce from 12kHz to 8kHz
90 °C	Auto reduce from 8kHz to 4kHz
97 °C	Over temp trip

7.2 De-rating for Effective Switching Frequency and Ambient Temperature

The tables below show the maximum permissible continuous output current as a percentage of the drive rated output current for each available effective switching frequency and the ambient temperature at which it applies.

7.2.1 IP20 Drives

	Permissible L	oad for each	Effective Sv	vitching Frec	uency Settir	ng at Ambien	t Temperati	ure

8 Immunity Tests

8.1 Electrostatic Discharge (ESD)

The Optidrive E3 product range has been designed and tested to comply with the limits defined in EN 61800-3:2004+A1-2012. The test techniques used are as defined in EN 61000-4-2:2009.

Application	Test points	Test Method	Level
	Control Terminals	Contact Discharge	±4kV
Direct	control terminals	Air Discharge	±8kV
	Power Terminals	Air Discharge	±8kV
Indirect	Vertical coupling plane	Contact Discharge	±4kV
indirect	Horizontal coupling plane	Contact Discharge±4kVAir Discharge±8kVAir Discharge±8kVContact Discharge±4kV	±4kV

8.2 Electrical Fast Transient Burst (EFT/B)

The Optidrive E3 product range has been designed and tested to comply with the limits defined in EN 61800-3: 2004+A1-2012. The test techniques used are as defined in EN 61000-4-4:2004.

Test points	Test Method	Level
Control Terminals	Capacitive clamp	±1kV at 5kHz
Motor Power Terminals	Capacitive clamp	±2kV at 5kHz
1-PH Supply Power Terminals	Coupling Decoupling Network	±2kV at 5kHz
3-PH Supply Power Terminals	Capacitive clamp	±4kV at 5kHz

8.3 Surge

The Optidrive E3 product range has been designed and tested to comply with the limits defined in EN 61800-3: 2004+A1-2012. The test techniques used are as defined in EN 61000-4-5:2006.

Drive Type	Test Method	Level
200-240V	Line to Line/Neutral	±1kV
200-2407	Line/Neutral to Earth	±2kV
380-480V	Line to Line	±2kV
380-4807	Line to Earth	±4kV

8.4 Dielectric strength (Flash)

The Optidrive E3 product range has been designed and tested to comply with the limits defined in EN 61800-5-1: 2007. The test techniques used are as defined in EN 61800-5-1: 2007.

Drive Type	Level
200-240V	1.5kV
380-480V	2.5kV

9 General Technical and Performance Data

9.1 Electrical Data

9.1.1 Mains Supply Details	
Supply Voltage Range	110 Volt Units – 110 – 115 Volt +10% / -10%
	230 Volt Units – 200 – 240 Volt +10% / -10%
	400 Volt Units – 380 – 480 Volt +10% / -10%
Supply Frequency	48 – 62Hz
Inrush Current	< rated input current
Power Up Cycles	>120x /hr, evenly spaced
Single Phase Operation	Three phase drives can be operated from a single-phase supply with 50% derating of the maximum output
	current
9.1.2 Motor Control	
Output Frequency Range	0 to 500Hz in 0.1 Hz steps
	Max Output Frequency = Max Switching Frequency / 16.
Output Voltage Range	0 to Supply Voltage
Speed Regulation	Open Loop < 2% motor rated speed
Torque Control	0 – 175% of rated torque, + / -5% accuracy, Response time <10ms
Effective Switching Frequency	Refer to section 3.1
Acceleration Time	0 – 600 seconds, 0.01s resolution
Deceleration Time	Two deceleration ramps
	0 – 600 seconds, 0.01s resolution
9.1.3 Overload Capacity	
Overload Capacity	150% of rated current for 60 seconds, repeat cycle every 10 minutes.
	175% / 4 seconds

9.2 Input Output Current Ratings

9.2.1 110V Input

Frame	Supply Voltage	Power Rating (kW)	Input Current	iTHD (%)	AC Line Choke	Input Current	iTHD (%)	Output Current
Size	110V. 1 Ph.	0.37	(A) 7.8		OPT-2-L1016-20	(A) 7.1		(A) 2.3
1	1100, 1 PH.	0.75	15.8	<60.0	OPT-2-L1016-20	15.0		4.3
2	110V, 1 Ph.	1.1	21.9		OPT-2-L1025-20	20.1		5.8

The data above is provided to show typical values. Results measured at the point of installation may vary according to the installation site and load conditions Test results are measured under the following conditions: -

- 400 Volt RMS AC Supply Voltage
- Operating IE2 motor with matching power rating according to the drive
- Operated at full rated output current capacity

9.2.2 230V Input

Frame	Supply	Power	Input	iTHD	AC	Input	iTHD	Output
Size	Voltage	Rating	Current	(%)	Line	Current	(%)	Current
		(kW)	(A)		Choke	(A)		(A)
		0.37	3.7	<175%	OPT-2-L1016-20	2.9		2.3
	230V, 1ph	0.75	7.5	<175%	OPT-2-L1016-20	6.6		4.3
1		1.5	12.9	<175%	OPT-2-L1016-20	9.7		7.0
1		0.37	3.4	<85.0	OPT-2-L3006-20	3.4		2.3
	230V, 3ph	0.75	5.6	<85.0	OPT-2-L3006-20	5.6		4.3
		1.5	9.5	<85.0	OPT-2-L3010-20	6.3		7.0
	230V, 1ph	1.5	12.9	<125.0	OPT-2-L1016-20	11.4		7.0
2	2500, 101	2.2	19.2	<100.0	OPT-2-L1025-20	17.0		10.5
2	230V, 3ph	1.5	8.9	<85.0	OPT-2-L3006-20	7.0		7.0
	250V, 5pm	2.2	12.1	<85.0	OPT-2-L3010-20	9.9		10.5
	230V, 1ph	4.0	29.2	<125.0	-	25.9		15.3
3	230V, 3ph	4.0	20.9	<85.0	OPT-2-L3036-20	13.5		18
	250V, 5pm	5.5	26.4	<85.0	OPT-2-L3036-20	17.4		24
		5.5	26.9	<85.0	OPT-2-L3036-20	22.0		24
4	230V, 3ph	7.5	33.3	<85.0	OPT-2-L3036-20	27.7		30
		11	50.1	<85.0	OPT-2-L3050-20	41.7		46

The data above is provided to show typical values. Results measured at the point of installation may vary according to the installation site and load conditions Test results are measured under the following conditions: -

- 230 Volt RMS AC Supply Voltage
- Operating IE2 motor with matching power rating according to the drive
- Operated at full rated output current capacity

9.2.3 400 / 460 Volt Input

		Power	Input	iTHD	AC	Input	iTHD	Output
Frame	Supply	Rating	Current	(%)	Line	Current	(%)	Current
Size	Voltage	(kW)	(A)		Choke	(A)		(A)
1		0.75	3.5	<85.0	OPT-2-L3006-20	1.5		2.2
1		1.5	5.6	<85.0	OPT-2-L3006-20	2.7		4.1
		1.5	5.6	<85.0	OPT-2-L3006-20	4.5		4.1
2		2.2	7.5	<85.0	OPT-2-L3006-20	5.5		5.8
		4.0	11.5	<85.0	OPT-2-L3010-20	9.2		9.5
	400V, 3ph	5.5	17.2	<85.0	OPT-2-L3036-20	14.5		14
3		7.5	21.2	<85.0	OPT-2-L3036-20	17.2		18
		11	27.5	<85.0	OPT-2-L3036-20	21.7		24
4		15	34.2	<85.0	OPT-2-L3036-20	27.0		30
4		18.5	44.1	<85.0	OPT-2-L3050-20	34.8		39
		22	51.9	<85.0	OPT-2-L3050-20	40.9		46

The data above is provided to show typical values. Results measured at the point of installation may vary according to the installation site and load conditions Test results are measured under the following conditions: -

- 400 Volt RMS AC Supply Voltage
- Operating IE2 motor with matching power rating according to the drive
- Operated at full rated output current capacity

9.3 Standby Power Consumption

The following table shows the power consumption of the drive under the following conditions.

- Drive is powered from the nominal rated mains supply voltage (e.g. 230 or 400 Volt)
- Output disabled
- Cooling fan off
- No external power drawn from the control terminals

Frame Size	Voltage	Phase	Consumption				
1	230	1	3.07W				
	230	3	3.07W				
	400	3	4.55W				
2	230	1	4.51W				
	230	3	4.51W				
	400	3	6.44W				
3	230	1	5.16W				
	230	3	5.16W				
	400	3	6.42W				
4	230	3	7.54W				
	400	3	14.6W				
	VICPAS HMI Parts Center						

9.4 DC Bus Discharge Time

DC Bus discharge times are based on maximum continuous rated DC bus voltage. In compliance with EN 61800-5-1:2007, all drives have a caution on the rating labels stating "Power down for 5 minutes before removing cover"

Frame	Supply		DC Bus Voltage		
Size	Voltage	Max	after 5s	after 60s	reach 50V
1	240Vac +10%	375	323	24.8	26 sec
1	480Vac +10%	680	510	36	34 sec
2	240Vac +10%	375	332	27.3	42 sec
Z	480Vac +10%	680	564	24.5	48 sec
3	240Vac +10%	375	324	36.4	27 sec
5	480Vac +10%	680	601	59.6	109 sec
4	240Vac +10%	375	301	28.6	46 sec
4	480Vac +10%	680	610	40.2	58 sec

9.5 Earth Leakage Current (Touch Current)

The Optidrive E3 product range has been designed and tested to comply with the limits defined in EN 61800-5-1: 2007. The test techniques used are as defined in EN 60990:2000.

As stated in the standard 61800-5-1:2007, 5.2.3.5 the motor does not have to be loaded, however, the motor type, cable type and length can have a significant impact on the results.

Frame	Typical Supply Co	onditions	Maximum Supply Co	onditions
Size	Supply Voltage	I _{Touch} (mA)	Supply Voltage	I _{Touch} (mA)
	1ph 230V 50Hz	3.5	1ph 240V +10% 60Hz	4.8
1	3ph 230V 50Hz	4.6	3ph 240V +10% 60Hz	7.5
	3ph 400V 50Hz	8	3ph 480V +10% 60Hz	13
	1ph 230V 50Hz	3.5	1ph 240V +10% 60Hz	4.8
2	3ph 230V 50Hz	4.7	3ph 240V +10% 60Hz	7.2
	3ph 400V 50Hz	8.1	3ph 480V +10% 60Hz	12.6
	1ph 230V 50Hz	3.5	1ph 240V +10% 60Hz	4.7
3	3ph 230V 50Hz	4.7	3ph 240V +10% 60Hz	6.8
	3ph 400V 50Hz	8.1	3ph 480V +10% 60Hz	12.7
4	3ph 230Vac 50Hz	4.8	3ph 240V +10% 60Hz	6.9
4	3ph 400Vac 50Hz	8.2	3ph 480V +10% 60Hz	12.9

NOTE

The Touch Current value is based on: -

Normal operating conditions, i.e. all phases balanced and connected correctly with the motor running

8 – 30 V dc, Internal or External supply, NPN (positive logic)

• Drive fitted with integrated EMC filter

9.6 Digital & Analog I/O

9.6.1 Digital Inputs Specification

Voltage Range	
Response Time	

Time < 8ms
9.6.2 Analog Inputs Specification

Range	Current: 0-20mA, 4-20mA. 20mA max input current
	Voltage: -10-10V (Analog Input 1 Only), 0-10V, 0-5V, 0/24V, 30V max input
Resolution	Analog Input 1: 12-bit, <16ms response time (Uni-Polar)
	Analog Input 2: 12-bit, <16ms response time (Uni-Polar)
Accuracy	better than 1% of full scale
Scaling & Offset	Parameter adjustable

9.6.3 Analog Output Specification

Range	Current: 020mA, 420mA, 20mA max Analog: 010V, 0 / 24V (digital), 20mA max
Resolution	10-bit
Accuracy	better than 1% of full scale

9.6.4 Relay Output

Maximum Switching Voltage :	250VAC, 30 VDC
Maximum Switching Current :	5A at 30 Volt DC, 6A at 250 Volt AC

9.7 Environmental Data

9.7.1 Temperature Range				
Ambient Temperature Range: Operation	IP20 Drives: -10 - +50	IP20 Drives: -10 - +50°C (14 - 122°F) without derating		
	IP55 & IP66 Drives: -:	IP55 & IP66 Drives: -10 - + 40°C (14 - 104°F) without derating		
Note: No frost or condensation permissible				
Ambient Temperature Range: Storage	-40 60 °C. No Frost or Condensation			
9.7.2 Altitude				
Maximum Altitude (No derating)	1000m Derate above	1000m by 1% per 100m		
Maximum Altitude (UL Approved)	2000m			
Maximum Altitude	4000m			
9.7.3 Relative Humidity				
Relative Humidity Limit	95% Maximum, non-	95% Maximum, non-condensing		
9.7.4 Contamination Levels				
Standard	IEC 721-3-3, Non-conductive dust allowed			
Transportation	Class 1C2 (chemical g	gases),		
	Class 1S2 (solid particles)			
Storage	Class 2C2 (chemical g	Class 2C2 (chemical gases),		
	Class 2S2 (solid particles)			
Operation	Class 3C2 (chemical gases),			
	Class 3S2 (solid particles			
9.7.5 Vibration Levels				
Shock Test	Pulse Shape	Half-Sine		

Shock Test	Pulse Shape	Half-Sine
	Peak Acceleration	15g
	Duration	11ms
	Axes Tested	3 Orthogonal
	Number of Shocks	3 in each direction (18 in total)
	Configuration	Non-operational throughout
Sinusoidal vibration test	Frequency Range	10Hz – 150Hz
	Severity	10Hz – 57.55Hz: 0.15mm peak-peak displacement
		57.55Hz – 150Hz: 1g peak acceleration
	Sweep Rate	1 octave/minute
	Axes Tested	3 Orthogonal
	Number of Cycles	10 cycles/axis (1 cycle consists of an up and a down sweep)
	Configuration	Non-operational throughout

9.8 Response Times

Command Source	Response Time
Digital Input	<8ms
Analog Input	<16ms
Modbus RTU Interface	<8ms from receipt of valid command
CAN Interface	<8ms from receipt of valid command
Master / Slave Function	<8ms, response, 60ms cycle
Power Stage	<10ms to enable output

9.9 Motor Control Performance

9.9.1 V/F Mode

Speed Regulation: + / - 20% of motor slip with slip compensation enabled

9.9.2 Vector Mode

Static Speed Accuracy:	+ / - 0.033%	
Speed Regulation	0 – 100% Load Range: + / - 1%	
Torque Response:	1- 8ms	
Torque Linearity	(10 – 90% of motor rated speed, 20 – 100% load torque range):	+/-5%

9.10 Output Current Limit

9.10.1 Overload Operation

Optidrive E3 provides the following overall limits:

- 150% Output current / 60 Seconds Maximum
- 175% Output current / 3.75 Seconds Maximum

9.10.2 Overview

Optidrive E3 features both hardware and software protection of the output stage to prevent damage. In addition, an Ixt system is used to monitor motor overload condition and prevent damage to the motor due to operation for prolonged periods at high load.

I x t protection is software based, using the value for motor rated current programmed in P-08. An internal accumulator register is used to estimate the point at which damage may occur to the motor, and operates as follows

Motor Current < P-08

The accumulator value reduces towards zero. The time required depends on the actual load current as explained further below.

Motor Current = 100% P-08

The accumulator value remains static.

Motor Current > 100% P-08 < 150% P-08

The accumulator value increases at a rate proportional to the overload level, e.g. (Motor Current / Rated current) – 100%. If the overload limit is reached, the drive will trip, displaying it.trp. to protect the motor.

Motor Current > 150% P-08

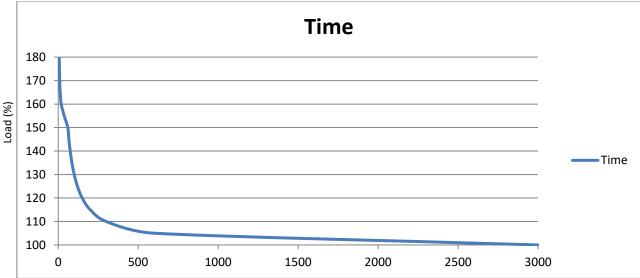

For high current levels, the accumulator operates 16 times faster than for current levels below 150% of P-08.

Peak over current trip levels are shown in the table below.

9.10.3 Example Operation

Maximum overload operation is 150% of motor rated current for 60 seconds. As this represents an overload of 50%, the accumulator trip level is 3000. This means that if the drive operates with 125% load current, the time can be calculated as 3000 / (125 - 100) = 120 Seconds. Above 150% load, accumulation is 16 times faster, hence for 160% load current, the time is 3000 / 16 / (160 - 150) = 18.75 seconds

9.10.4 Overload Curve

9.10.5 Additional Special Case Overload Operation

For ODE-3-240095-3F4# models, when output frequency <5Hz, overload accumulation is 2.5 times faster.

9.11 Under / Over Voltage Trip Levels

The following levels are not user adjustable and define the operating voltage levels of the drive and brake chopper circuit.

Drive Rated	Drive Type	DC Bus Voltage Level (Volts DC)				
Supply Voltage		Brake	Brake	Under	Minimum	Over
		Chopper	Chopper	Voltage	Operating	Voltage
		On	Off	Trip	(Inrush	Trip
					Disabled)	
110 – 115 Volts AC	Single Phase Output	195	189	80	113	208
110 – 115 Volts AC	Voltage Doubler	390	378	160	239	418
200 – 240 Volts AC	All	390	378	160	239	418
380 – 480 Volts AC	All	780	756	320	478	835
