Standard Specification for
Martensitic Stainless Steel Bars for High-Temperature Service

This standard is issued under the fixed designation A 565/A 565M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers hot-finished and cold-finished martensitic chromium steel bars for high-temperature service. The mechanical properties are developed by suitable heat treatment, as indicated for each alloy.

1.2 Where strength at temperature is a factor, these steels are generally limited to a maximum service temperature of 1200°F [650°C]. For oxidation (scaling) resistance and at low stresses, these steels are useful to 1450°F [790°C].

1.3 This specification is expressed in both inch-pound units and SI units; however, unless the purchase order or contract specifies the applicable M specification designation (SI units), the inch-pound units shall apply. The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
A 484/A 484M Specification for General Requirements for Stainless Steel Bars, Billets, and Forgings
A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
A 994 Guide for Editorial Procedures and Form of Product Specifications for Steel, Stainless Steel, and Related Alloys
E 112 Test Methods for Determining Average Grain Size
E 292 Test Methods for Conducting Time-for-Rupture Notch Tension Tests of Materials
E 527 Practice for Numbering Metals and Alloys in the Unified Numbering System (UNS)
SAE J1086 Recommended Practice for Numbering Metals and Alloys (UNS)

3. Ordering Information

3.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered under this specification. Such requirements may include, but are not limited to, the following:

3.1.1 Quantity (weight or number of pieces);
3.1.2 Name of material (martensitic stainless steel);
3.1.3 Form (bar, etc.);
3.1.4 Condition;
3.1.5 Finish;
3.1.6 Size, or applicable dimension including diameter, thickness, width, length, etc.;
3.1.7 Grade designation (Table 1); and
3.1.8 ASTM designation number and date of issue.

4. General Requirements

4.1 Product furnished to this specification shall conform to the requirements of Specification A 484/A 484M, including any supplementary requirements indicated in the purchase order. Failure to comply with the general requirements of Specification A 484/A 484M constitutes nonconformance with this specification. In case of conflict between the requirements of this specification and Specification A 484/A 484M, this specification shall prevail.

5. Manufacture

5.1 Heat Treatment:

5.1.1 The product forms covered in this specification may be furnished in one of the following conditions:

5.1.1.1 Condition A—Annealed,
5.1.1.2 Condition T—Heat treated (for machining),

5.1.1.3 Condition HT—Heat treated (for high-temperature service), or
5.1.1.4 Condition H—Heat treated.

2. Condition and Finish:
2.1 Bars may be furnished in one of the following hot-finished conditions:
2.1.1 Hot rolled, or
2.1.2 Rough turned (rounds only).
2.2 Bars may be furnished in one of the following cold-finished conditions:
2.2.1 Cold drawn,
2.2.2 Centerless ground (rounds only), or
2.2.3 Polished (rounds only).

6. Chemical Requirements
6.1 Each alloy covered by this specification shall conform to the chemical composition specified in Table 1.
6.2 Methods and practices relating to chemical analysis required by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751.

7. Metallurgical Requirements
7.1 The microstructure shall not contain more than 5% delta-ferrite after full heat treatment as described in Table 2. Visual examination for the volume fraction of delta ferrite of various representative areas of examination is acceptable. When the visual estimation method indicates the delta ferrite content is greater than the allowed limit, the manufacturer may employ Test Method E 562 for determining the acceptability of the lot.

8. Mechanical Properties Requirements
8.1 The material shall conform to the mechanical properties listed in Table 3 for the ordered condition.
8.2 Material furnished in Condition A or T shall be capable of developing the room-temperature properties specified for Condition HT when subjected to heat treatment as specified in Table 2.
8.3 The yield strength shall be determined by the offset method as described in the current edition of Test Methods and Definitions A 370.
8.4 The impact strength shall be determined at 70 to 80°F [21 to 27°C], by Charpy V-notch specimen Type A as described in Test Methods and Definitions A 370.
8.5 Stress rupture testing of UNS S42226 shall be conducted as specified in Table 4 using a combination test bar in accordance with Test Methods E 292. Rupture must occur in the smooth section of each test specimen. The test may be discontinued after the time specified, provided the certification

A New designation established in accordance with Practice E 527 and SAE J1086.
so notes. Stress rupture testing is not required on bars less than 1⁄2 in. in diameter or thickness.

9. Keywords
9.1 martensitic stainless steel; stainless steel bars; stainless steel billets; stainless steel forgings; temperature service applications—high

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the purchaser in the inquiry, contract, and order. Details of these supplementary requirements shall be agreed upon by the manufacturer and purchaser.

S1. Non-Destructive Examination—Grade D

S1.1 Method—Each bar shall be subjected to NDE. The method used shall be: Eddy Current (ET), Magnetic Particle (MPI wet or dry), Liquid Penetrant (LPI), or Ultrasonic (UT), at the option of the vendor unless otherwise indicated in the purchase order.

S1.2 Acceptance Criteria—For LPI or MPI, linear indications (those indications longer than 1⁄16 in. [1.5 mm] with a length greater than three times their width) are unacceptable. For UT or ET, reject levels for linear indications shall be based on the alarm response from a 0.012-in. [0.3-mm] maximum deep surface notch in a calibration bar.

S2. Microstructure—UNS S42226

S2.1 Metallographic inspection shall be performed at 100× magnification to determine the metallurgical structure, grain size, and delta ferrite content.

S2.2 The microstructure shall be tempered martensite with no more than 1 % delta ferrite.

S2.3 The average grain size shall be 4 or finer. The maximum size of individual grains, distributed at random, shall be a 2. When the average grain size is 5 or finer, only the average size needs be reported. Grain size determination shall be performed in accordance with Test Methods E 112.
